Education

McMaster University — Hamilton, Ontario, Canada
B.Eng.Mgt in Software Engineering and Management (co-op) — Sep. 2021 – Apr. 2027 (expected)
GPA: 10.6/12; Dean's Honour List (4x) — *5 year degree & 16 months co-op*

Skills

Languages: Kotlin, TypeScript, Java, Python, SQL

Technologies: Temporal, Spring Boot, GraphQL, Liquibase, React, JPA/Hibernate, PostgreSQL, WebSockets, Google Dialogflow

Tools: Claude Code, Datadog, Figma, Notion, Jira, Git, GitHub Actions, Postman

Experience

Wealthsimple

Software Development Intern — *Jan. 2026 – Aug. 2026*

- Designed and shipped an **order archiving** system moving closed orders into a dedicated 11-table archive schema with tenancy-aware reads, drained by a Temporal workflow with a matching reverse-archive path for safe recovery
- Led the full-stack rebuild of the internal Orders page monitoring **30,000+ orders/day** for CX and ops, shipping a new GraphQL endpoint in Kotlin/Spring Boot, a redesigned TypeScript/React frontend, and detail views for crypto, options, DRIP, and managed accounts
- Shipped **Norbert's Gambit** emails reaching 3,000+ clients weekly, refactored the shared notification code (models, utils, SQS publisher) into a common library used across order services, and authored a Claude Code skill that walks developers through adding new notification flows
- Owned end-to-end migration of **40+ production order monitors** off a legacy Guice framework onto Spring Boot across 15+ batches, spanning equity, options, fractional, and cross-market flow monitors, preserving alerting continuity throughout
- Contributed backend, notifications, and trade confirmation support for Wealthsimple's **IPO access** launch, including API-layer duplicate-order rejection to prevent over-allocation and IPO-specific wording for order-cancelled and order-rejected notifications
- Added to the secondary on-call rotation for order execution, resolving all incoming client-escalation tickets with same-day turnarounds on cases including double-charged trades, TFSA execution issues, and USD/CAD conversion mismatches

Royal Bank of Canada

Software Engineering Intern — *Sep. 2025 – Dec. 2025*

- Shipped TypeScript/React features on Tia, RBC's internal tech support bot serving **85,000+ employees**
- Built an automated ticket escalation flow that cut ServiceNow team manual work by **30%** and improved critical-issue response times
- Added bilingual English/French support and tuned Google Dialogflow's natural language understanding, reaching **15,000+ additional users**

Royal Bank of Canada

Developer, RBC Amplify Program — *May 2025 – Aug. 2025*

- Built a **patent-pending wire payment routing engine** on a Java/Spring Boot backend with PostgreSQL, integrating the SWIFT reference table with internal routing rules
- Designed the routing rules as a configurable system so non-technical teams could update logic as business requirements evolved, without engineering involvement
- Presented the product to RBC's CTO, CFO, and hundreds of attendees, earning **Technical Distinction**, the program's top engineering award

Projects

Declaration | *Repo* | *Site*

- Built so my friends could keep playing cards after we scattered across cities. A **Kotlin** backend and **TypeScript/React** frontend over **WebSockets**, with bot opponents so a short lobby still starts

Careerdle | *Repo* | *Site*

- Turned the "name that player" posts going around Instagram into a proper daily game where you guess an athlete from their career path, with TS + React and deployed on Cloudflare Pages

Awards & Achievements

Technical Distinction, RBC Amplify: $20,000 top engineering prize for engineering craftsmanship. Featured in McMaster Engineering publication (link).

Provisional Patent: Filed for a rule-based wire payment routing engine allowing non-technical teams to modify routing logic as business requirements evolve.
